

## Integrating iCommNet® KC Search™ OEM Solutions and Technologies

Integrating iCommNet® technologies and solutions offers instant benefits to you and your customers; i.e., adding strategic values to your businesses and additionally increasing direct values for your customers.

Embedding iCommNet solutions is simple. The iCommNet KC Search Developer™ OEM Edition is the KC Search SDK that includes intelligent and precision search engine kernels, simple abstraction layer APIs, and small foot-print DLLs that can be integrated or adapted to your software products; e.g., Web applications in the cloud or client/server environment, SaaS, search engines, and enterprise products.

Two KC Search OEM SDKs are available. Assume Fig 1 depicts your current search implementation.

**KC Search OEM Standard™** offers a full set of linguistic features embedded in the KC Natural Language Processor™; e.g., Instant Learning. Your customers can use natural, conversational English sentences without being limited to a few keywords when using your applications, thus allowing your customers to use descriptions in conversational English. As Fig 2 depicts, the KC Natural Language Processor then extracts keywords from the descriptions and invokes your keyword search engine.

**KC Search OEM Professional™** embeds the iCommNet KC Precision Search kernel, thus integrating NLP-based precision and intelligent search solutions to your applications. Host applications simply invoke KC APIs to extract and search. Then, host applications receive search results in XML, on a search-once basis, identifying search results as Fig 3 shows.

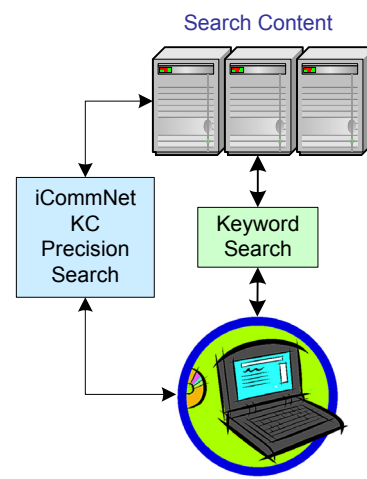

Fig 3: KC Search OEM Professional

The KC Search Developer OEM Edition consists of KC Search Core products: KC Precision Search™, KC Fine-Grain Search™, and KC Remote Search™ powered by KC Natural Language Processor and KC Search Companion products. By integrating KC Search Developer OEM Edition, your host applications can provide the numerous benefits that linguistics-based, precision search technologies offer.
